

T-8200AC

42RLE Output Shaft Removal Tool

2003-2009 Chrysler/Dodge/Jeep

When used in the 4WD application, the 42RLE's output shaft is retained to the rear planet with a squared circlip. Similar to most front wheel drive axles but much more permanent. To enable complete unit disassembly, you must remove the output shaft to gain access to the large nut holding the rear planet. With our new **T-8200AC** installed, a slide-hammer (with 3/4-16 thread pitch) will make quick work of this seemingly impossible task!

We mill **T-8200AC** from steel and include a strong, easily replaceable grade 8 cap screw. Be ready for the next one to hit your bench!

An economical yet durable answer to another perplexing problem!

Answering challenges with profitable solutions.
